Interpretative Summary for **March 5, 2021**

An Effective New Tool in the Toolbox

Vaccines are critical tools for ending the COVID-19 pandemic, and we just got a new one. On February 28, CDC released an [official recommendation](#) to use Johnson & Johnson's Janssen (J&J/Janssen) vaccine, which is safe and effective in preventing severe COVID-19 illness, hospitalization, and death. This vaccine is being distributed now. The J&J/Janssen vaccine protects against COVID-19 in one dose, not two, and can be stored at a standard refrigerator temperature instead of needing colder storage. These advantages can help the vaccine reach most communities and mobile sites, as the supply of vaccines increases.

Vaccinations, wearing a well-fitted mask, and taking other precautions to prevent the spread of COVID-19 can help end the pandemic. We need to use all tools in the toolbox, accelerate vaccination and ensure vaccines are distributed equitably, and learn from our initial successes.

Use all tools in the toolbox. On February 27, 2021, the Food and Drug Administration (FDA) issued an Emergency Use Authorization (EUA) for the J&J/Janssen vaccine. On February 28, 2021, CDC's Advisory Committee on Immunization Practices (ACIP) issued an interim recommendation for use of the J&J/Janssen COVID-19 vaccine in people 18 years of age and older for the prevention of COVID-19.¹ This vaccine is the third COVID-19 vaccine authorized under an EUA for the prevention of COVID-19 in the United States. CDC's COVID Data Tracker has begun providing data by [type of vaccine](#), which will soon include the J&J/Janssen vaccine.

Accelerate vaccination and ensure equity. Vaccination has continued to increase this week with 16.3% of the [total population](#) vaccinated with at least one dose (including 21.2% 18 years of age and older) as of March 4, 2021. CDC provides [vaccination data](#) by race and ethnicity, age, and sex. Continued efforts are needed at the national, state and local levels to monitor for and ensure equity in vaccine distribution and administration.

Learn from our initial success. Cases in skilled nursing facilities, for example, have [declined up to 80%](#) from the peak in late December. As we enter spring, we need to stay focused on reducing spread in our communities. This means we need to continue to practice [proven prevention strategies](#) including wearing a well-fitted mask, staying six feet apart from people we don't live with, avoiding gatherings, washing hands often, staying home when sick, and getting vaccinated when the vaccine is available to you.

Reported Cases

Daily Trends in COVID-19 Cases in the United States
Reported to CDC

Beginning on January 11, the 7-day average of newly reported cases declined for 43 consecutive days. There was a brief increase between February 27 and March 1, 2021; and as of March 2, the 7-day average of new cases began to decline again. There has been an overall decline of 74.9% of the 7-day moving average since the highest 7-day average of 249,360 on January 11, 2021. On March 3, there was a 5.7% decrease in the 7-day average number of daily cases reported compared with the prior week, which provides an encouraging sign of continued progress. Even with these declines, the 65,424 cases reported on March 3 remains much higher than what was seen during the first peak in the pandemic on April 6, 2020 of 42,597 cases.

[More Case Data](#)

65,424 New Cases Reported	62,555 Current 7-Day Average**
28,580,198 Total Cases Reported	66,306 Prior 7-Day Average
249,360 Peak of 7-Day Average*	-5.7% Change in 7-Day Average since Prior Week

*Highest peak for 7-day average (January 11, 2021).

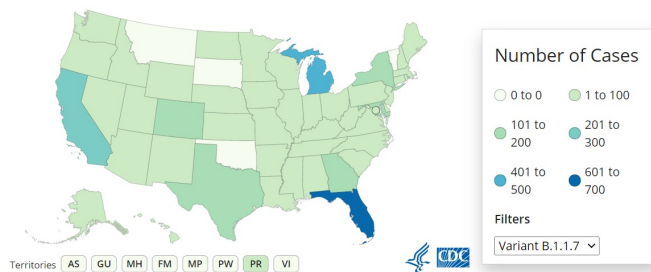

** The current 7-day average of new cases is impacted by a historical correction of 8,585 cases; 2,990, 1,840, and 1,641 historical cases were reported by Texas on February 27, March 1 and March 3, 2021, respectively; and Alabama reported a historical correction of 2,114 cases on March 3, 2021. The 7-day average number of new cases (excluding historical cases reported in the past two weeks) decreased by 7.5% to 61,329 new cases per day compared to the previous 7-day average of 66,306.

SARS-CoV-2 Variants

CDC is closely tracking variants of SARS-CoV-2, the virus that causes COVID-19. Three variants of concern have been detected in the United States: B.1.1.7,

Emerging Variant Cases of B.1.1.7 in the United States

B.1.351, and P.1. A total of 2,672 B.1.1.7 variant cases have been reported in 48 jurisdictions. Sixty-eight cases attributed to B.1.351 in 17 jurisdictions and 13 cases attributed to P.1 in seven states have also been detected in the United States. CDC and partners are increasing the numbers of specimens sequenced in laboratories around the country. The number of variants reported will likely increase as more specimens are sequenced and if the frequency of variants increases. Studies are underway to determine whether variants cause more severe illness or are likely to evade immunity brought on by prior illness or vaccination. CDC published two reports this week on variants. ^{2,3}

Variant	Reported Cases in US	Number of Jurisdictions with ≥1 Case Reported
B.1.1.7	2,672	48
B.1.351	68	17
P.1	13	7

Testing

The percent of COVID-19 RT-PCR tests that are positive (percent positivity) continues to decline. The 7-day average of percent positivity from tests is now 4.5%. The 7-day average test volume for February 19-25, 2021 was 1,212,844, up 10.5% from 1,097,940 the prior 7 days.

Vaccinations

The U.S. COVID-19 Vaccination Program began December 14. As of March 4, 2021, 82.6 million vaccine doses have been administered. Overall, about 54.0 million people, or 16.3% of the U.S. population, have received at least one dose of vaccine. About 27.8 million people, or 8.4% of the U.S. population, have received two doses of vaccine. As of March 4, the 7-day average number of administered vaccine doses reported to CDC per day was 2.0 million, a 36% increase from the previous week. Data by [type of vaccine](#), which will soon include the J&J/Janssen vaccine, is available on CDC's COVID Data Tracker.

Deaths

In recent weeks, the number of COVID-19 deaths has fluctuated. However, there has been an overall decline of 43.1% of the 7-day moving average since January 13, 2021. As of March 3, 2021, a total of 517,224 COVID-19 deaths were reported. The current 7-day average of deaths is 1,921 deaths, a 6.7% decrease from the previous 7-day average of 2,060 daily deaths.

Notes

The Coronavirus Disease 2019 (COVID-19)-Associated Hospitalization Surveillance Network (COVID-NET) is an additional source for hospitalization data collected through a network of more than 250 acute-care hospitals in 14 states (representing ~10% of the U.S. population). Detailed data on patient demographics, including race/ethnicity, underlying medical conditions, medical interventions, and clinical outcomes, are [collected using a standardized case reporting form](#).

CDC's website also provides new data views such as county-specific summaries (under "Your Community" in Data Tracker), vaccination trends (under "Your Community" in Data Tracker), and [information on SARS-CoV-2 variants](#).
